Attention: Darren Cizmar, Project Manager

Dear Mr. Cizmar

Subject: Highway 401 Colborne to Brighton Drainage and Hydrology Study and Preliminary Design Report
Client ref.: GWP 4054-17-00

We are pleased to submit one electronic copy of the Final Drainage and Hydrology Study and Preliminary Design report for Highway 401 Colborne to Brighton. This report documents the existing and proposed drainage conditions, the completed hydrologic and hydraulic analysis for the structural and non-structural culverts as well as the storm sewer design for the preferred alternative.

We trust the submission of this documents meets your requirements. Should you have any comments we look forward to your response.

Yours sincerely,

A handwritten signature in black ink, appearing to read 'Sherif Iskandar'.

Sherif Iskandar, M.Sc., P.Eng., PMP
Senior Project Manager, Water Resources

1 INTRODUCTION

1.1 Authorization

WSP was retained by the Ministry of Transportation Ontario to complete the Preliminary Design and Class Environmental Assessment (EA) of Highway 401 from 0.8 km east of Percy Street to 0.4 km west of Christiani Road (GWP 4054-17-00) for the replacement / rehabilitation of three bridges (Herley Road, Lake Road, and County Road 26 underpasses) and four structural culverts. This study also includes establishing the future Highway 401 footprint for an interim six lanes and ultimate eight lanes to address current and future transportation needs, and commuter parking lot improvements at County Road 30.

This report includes the drainage analysis of each structural and non-structural culvert. This consists of a hydrologic and hydraulic assessment of the existing conditions and proposed conditions for the culverts. It also contains the existing and proposed preliminary analysis of the storm sewers within the project limits. A preliminary stormwater management plan is also included.

1.2 Highway Classification and Location

Highway 401 is classified as a rural freeway, undivided. The project area is along Highway 401 between Colborne and Brighton, Ontario. The approximate study area is shown in **Figure 1**.

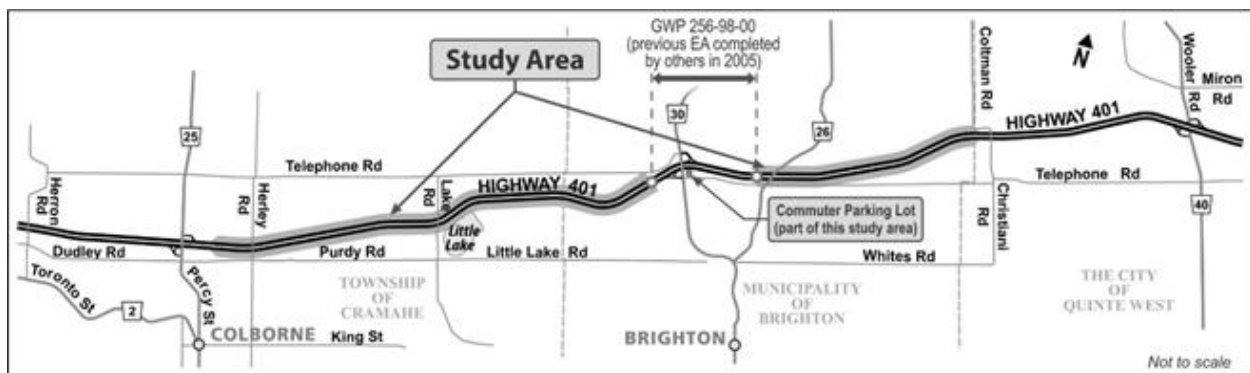

Figure 1: Approximate Study Area

1.3 Objectives

The objective of the drainage component of this assignment is to complete the Preliminary Design for replacement or rehabilitation of structures and for future widening of Highway 401, which includes the following:

- Verify the existing structural and non-structural culvert conditions and capacities for each culvert
- Analyze the existing storm sewer system
- Evaluate all culverts and storm sewers based on the proposed alternative
- Determine the preliminary stormwater management plan to achieve water quantity and quality control

2 BACKGROUND INFORMATION

2.1 Existing Background Information

WSP reviewed previous drawings and relevant drainage information and mapping. This included:

- Contract Drawings
 - Contract No. 1958-5500
 - Contract No. 1960-0217
 - Contract No. 1997-0057
 - Contract No. 1998-0008
 - Contract No. 2015-4021
 - Contract No. 2018-4004
 - Contract No. 2018-4022
 - Contract No. 2019-4001
- Survey road profiles and plans
 - B104012
 - B104013
 - C104012
 - C104013
- Base plans and road profiles in CAD format
- Digital base mapping including contour information
- Final Culvert Condition Report, Highway 401, Brighton Township, Ainley Group, February 2015
- Final Culvert Condition Report, Highway 401, Cramahe Township, Ainley Group, February 2015

2.2 Drainage Design Guidelines and Reference Documents

The MTO has prepared various directives and manuals that outline the approach and guidelines to access highway drainage systems. This assessment used the following guidelines:

- MTO Highway Drainage Design Standards (HDDS) (2008)
- MTO Drainage Management Manual (1997)
- MTO Drainage Directives and Policies
- MTO Guide for Preparing Hydrology Report for Water Crossings
- MTO Gravity Pipe Design Guidelines (April 2014)
- MTO PEM-DCSO #2016-14 Ministry’s Climate Change Consideration in Design of Highway Drainage Infrastructure
- PLNG-B014, MTO Drainage Management Policy and Standards
- Ontario Ministry of the Environment (now MECP) Stormwater Management Planning and Design Manual (2003)

MTO’s Highway Drainage Design Standards establish standards for designing Surface Drainage Systems (SD) and Water Crossings (WC). **Table 2-1** summarizes the standards that are relevant to this study area.

Table 2-1: Relevant Standards for HDDS

Standard	Description
SD-1: Design Flows for Surface Drainage Systems	10-year design flow
SD-3: Flow Spread on to Travel Lanes	Lateral Spread Distance < 0 (Desirable Standard) Lateral Spread Distance < 2.5 m of Lane Width Clear (Minimum Standard) Maximum Depth of Flooding < 25 mm
SD-4: Storm Sewer System	Velocity > 0.75 m/s (trunk sewer, smooth walled pipes) {Desirable Standard} Velocity > 1.5 m/s (lateral sewers) {Desirable Standard} Velocity > 0.5 m/s (pipe can be flushed) {Minimum Standard} Pipe Diameter > 300 mm Pipe Spacing > 150 m (diameter < 1200 mm) Slope of Later Sewers > 0.015 m/m
SD-5: Storm Sewer Inlets – Continuous Grade	Spacing Between Inlets < 150 m
SD-6: Storm Sewer Inlets – Highway Sags	Inlet Capacity Reduced by 50% Minimum twin inlets at bottom of sag
SD-9: Roadside Ditches	Maximum depth of flow – 1 m Maximum Permissible Velocity – 1.5 m/s Minimum freeboard – 0.3 m

Standard	Description
SD-13: Design Flows and Freeboards – Culverts not on a watercourse	Minimum freeboard - 0.3 m
WC-1: Design Flows – Bridges and Culverts	50-year Design Storm for a Freeway 100-year Check Storm
WC-7: Culvert Crossings - Watercourse	Freeboard design for freeways ≥ 1.0 m Culverts with diameter or rise < 3.0 m HW/D ≤ 1.5 Culverts with diameter or rise 3.0 to 4.5 m HW ≤ 4.5 m Culvert with diameter or rise > 4.5 m HW/D ≤ 1.0
WC-8: Minimum Culvert Size	Minimum Culvert Size for Freeway Culverts: 800 mm minimum diameter for circular culverts 800 mm minimum rise for elliptical or arch culverts 900 mm minimum rise for box culverts
WC-10: Culvert Extensions	The slope of the Culvert Extension is not less than the slope of the original structure Culvert Extensions be of the same material as the original structure alignment and shape of the original structure be maintained
WC-13: Relief Flow – Bridges and Culverts	The maximum depth of flow on the roadway shall not exceed 0.3 m The product of the velocity and depth on the roadway shall not exceed 0.8 m/s
SW-1: Stormwater Management – Level Control	Peak flow rates for storms with the following return periods: 2-, 5-, 10-, 25-, 50-, 100-year Enhanced protection or greater when sensitive aquatic habitat will be impacted – SWM facilities that provide equivalent of 80% long-term suspended solids removal Normal protection when conditions for enhanced protection is not required – SWM facilities that provide the equivalent of 70% long-term suspended solids removal
SW-3: Roadside Ditches – Water Quality	Water quality – Highway Embankments shall be a minimum of 3 m in length Water quality – Roadside Ditch shall have a minimum base width of 1.0 m Water quality – minimum desirable length of the Roadside Ditch shall be 40 m

SD-1 Design Flows for Surface Drainage Systems: This standard identifies the minimum design flows that should be used for the sizing of road surface drainage systems. The design flow for a freeway minor system is the 10-year storm.

SD-3: Flow Spread on to Travel Lanes: This identifies the maximum allowable spread distance onto the travel lanes of a highway. It also defines the maximum depth of flow at the edge of the travel lanes. For freeways, the desirable standard is the maximum lateral spread distance shall be zero. The minimum standard is the maximum lateral spread distance shall be that a minimum of 2.5 m of the lane width remain clear of any flooding. The maximum depth of flooding at the lowest edge of the travel lanes shall not exceed 25 mm. It is MTO's policy to meet the desirable standard wherever feasible.

SD-4: Storm Sewer System: This standard identifies the design of the storm sewer systems and identifies the minimum allowable velocity, the minimum pipe diameter, the maximum spacing of maintenance holes, and the minimum slope of the lateral sewers. The desirable standard is a minimum allowable velocity in a trunk sewer is 0.75 m/s for smooth walled pipes and 1.5 m/s for lateral sewers. The minimum standard in a trunk sewer is a minimum allowable velocity of 0.5 m/s where the pipe can be flushed. The minimum pipe diameter is 300 mm. The maximum MH spacing between pipes ≤ 1200 mm Φ is 150 m. The spacing shall be reduced to 100 m when the desirable minimum allowable velocity is not achieved. The minimum slope of the lateral sewers is 0.015 m/m.

SD-5: Storm Sewer Inlets on a Continuous Grade: This standard identifies the maximum spacing between adjacent inlets. The maximum spacing between inlets shall be 150 m.

SD-6: Storm Sewer Inlets at Highway Sags: This standard identifies the placement of storm sewer inlets and quantifies the blockage at highway sags. Inlets at highway sag assume the capacity has been reduced by 50% as a result of a blockage. Sufficient inlet capacity shall be provided to conform to SD-3 and a minimum of twin inlets shall be placed at the bottom of the sag.

SD-9 Roadside Ditches: This standard identifies the minimum design requirement of Roadside Ditches for the conveyance of flow. It does not address the design of roadside ditches for improvement of water quality.

Roadside Ditches shall be designed to convey both the Minor System Design Flow and the Major System Design Flow.

The maximum depth of flow in the Roadside Ditch associated with the Minor System Design Flow shall be 1.0 m.

For the Major System Design Flow, the design of the roadside ditch shall ensure that Design Flow will not spread onto either the shoulder or the travel lane.

As a Desirable Standard, for the Major System Design Flow, water shall not extend beyond the Right-of-Way, and as a Minimum Standard any flow spread beyond the Right-of-Way shall not increase the existing extent of flooding.

The Maximum Permissible Velocity is governed by the channel lining, which shall be designed to resist erosion for the Major System Design Flow. In no case shall the velocity in a grass-lined channel exceed 1.5 m/s unless bioengineering techniques (e.g. reinforcing grid or mat) are used.

SD-13 Design Flow and Freeboard for a Culvert not on Watercourse: This standard identifies the design flow and the required minimum freeboard for culverts associated with runoff from roadways and local external catchments. The culverts that are subject to this standard would cross adjacent roads, interchange ramps, private entrances, driveways and maintenance roads. For these culverts the minimum freeboard measured vertically to the top of the subgrade upstream of the culvert is 0.3 m for the minor system design flow (the 10-year storm flow). There is no minimum freeboard associated with the major system design flow.

Culverts under private entrances such as driveways and maintenance accesses shall be designed for the same Design Flow as the Roadside Ditch (SD-9) leading up to the entrance of the culvert. As a minimum they shall be designed to convey the Minor System Design Flow. Culverts under highways, highway ramps and adjacent roadways shall be designed to convey the Minor System Design Flow and the Major System Design Flow.

The conveyance capacity of the culvert shall be set to match the design characteristics of the Roadside Ditch located immediately upstream of the culvert.

WC-1: Design Flows for Bridges and Culverts: This standard identifies the minimum Design Flows for the sizing of bridges and culverts for flow conveyance on Regulated and non-Regulated Watercourses. It also identifies the requirement for accommodating the Regulatory Flow on Regulated Watercourses, and for determining the maximum allowable increase in flood elevations upstream of a bridge or culvert. This standard provides the hydrologic basis for all water crossing standards.

This standard addresses the Design Flow requirements for standard road classifications and low volume roads.

WC-7 Culvert Crossings on a Watercourse: This standard identifies the minimum Freeboard, the minimum Clearance, and the maximum Flood Depth at culvert crossings. The standard also identifies the Freeboard requirement for walkways, bikeways and maintenance roads that are constructed within a culvert.

The Desirable Freeboard is measured vertically from the Energy Grade Line elevation for the Design Flow to the edge of the travelled lane. The Minimum Freeboard is measured vertically from the High-Water Level for the Design Flow to edge of the travelled lane.

WC-8: Minimum Culvert Size: This standard identifies minimum culvert sizes for various road types based on maintenance considerations.

The standards for Minimum Culvert Sizes are dictated by maintenance considerations, which require a sufficient height to access the barrel for cleaning and repairs.

Culverts shall be designed to satisfy the following requirements:

- to convey the Design Flow
- to account for increased sedimentation inside the barrel and ice built up
- to allow for fish passage
- to account for fluvial geomorphology characteristics
- to account for other factors such as wildlife passage, navigation, and trail access
- to countersink the culvert and install substrate material to restore fisheries habitat

WC-10: Culvert Extensions: This standard identifies the desirable Slope, Material, and Alignment for designing culvert extensions.

Extensions to existing culverts shall be designed to prevent internal blockages caused by changes in direction, changes in the shape of the cross-section, or changes in the number of openings or cells.

It is desirable that; the slope of the Culvert Extension not be less than the slope of the original structure, Culvert Extensions be of the same material as the original structure, and the alignment and shape of the original structure be maintained.

WC-13: Relief Flow (Bridges and Culverts): This standard addresses the control of flood flows conveyed over the roadway as Relief Flow at water crossings. The standard identifies the maximum depth and the maximum velocity of flow over the roadway.

SW-1: Stormwater Management-Level of Control: This standard identifies the level of control requirements for the design of stormwater management facilities for highways.

Stormwater Management (SWM) Ponds that are designed to improve water quality or to provide a Level of Control shall be designed such that the pond remains stable during the full range of design storms, and that the receiving system capacity and flood potential are not increased.

SW-3: Roadside Ditches for Water Quality: This standard provides the minimum design requirement for Roadside Ditches to achieve water quality control.

3 FIELD INVESTIGATION

A field investigation of the existing structural culverts was conducted by WSP staff on May 3 - 4, 2021. The purpose of the field investigation was to review the existing drainage conditions, confirm the drainage patterns and physical conditions of the existing structural culverts 471, 472, 473 and 474, while for the non-structural culverts, field investigation was completed under separate assignment and the Final Culvert Condition Reports were provided to WSP. The following office and field tasks were completed:

- Reviewed existing background information.
- Conducted a physical inspection of all structural culverts within the study limits including upstream and downstream ends.
- Conducted a physical inspection of the upstream and downstream channel characteristics.
- Verified the location, type, size, condition, cover depth, flow direction and culvert material for all structural culverts.
- Inspected highway embankments and channel bank conditions to identify areas of erosion.
- Prepared a photographic inventory of the four structural culverts in the study limits on both the upstream and downstream sides including side ditches.
- Provided recommendations for each structural culvert within the study limits based on physical conditions.

During this field visit, WSP staff also analyzed the other drainage issues that have been noticed along the study area, such as ponding in ditches and buried ditch inlets. These other drainage issues are further discussed in the following section.

The structural culvert inspection photographs are included in **Appendix A-1**, while the field inspection sheets are in **Appendix A-2**.

3.1 Existing Drainage Issues

WSP staff contacted MTO maintenance to meet on site for their input on the following drainage issues summarized in **Table 3-1**, unfortunately due to a schedule conflict, an on-site meeting was unable to take place. The table directly below, includes the issue description, site photographs, observations, and recommendations. Field notes for

drainage issue A can be found in culvert 471 inspection sheet while the rest of the drainage issues listed below, the field notes can be found in **Appendix A-3**.

[this page is intentionally left blank]

Table 3-1: Summary of Additional Drainage Issues and Recommendations

Drainage Issue	Pictures	Observations & Recommendations
<p>A - Crossing Culverts (0061 and 0010 in Cramahe Township) and the ditch are typically flooded which raises water level in Little Lake due to beaver dams on private property to the North of freeway. It impacts wells and septic systems.</p>		<p>Unstable marshy ground, unable to access and could not pass wildlife fence on the northside. It is recommended that the private owners be engaged to facilitate the relocation of the beaver activity with relevant agencies such as DFO. Under the Drainage Act, there is no precedent for beaver dam removal; however, DFO recommends that the local provincial wildlife management office be contacted for more information on beaver dam removal. In addition, DFO's "Code of practice: Beaver dam breaching and removal" must be followed.</p>
<p>B – Drainage issues between mile marker 506.4 - 507. Standing water within the ROW is a concern.</p>		<p>It was observed that blockages to the ditch catchbasins are the likely culprit to the standing water. Eastbound side, ditch drainage is poor, about 90% of ditch is standing water. Erosion was present and a silt fence is down. Westbound side, some ponding near fence line is present, however not as many drainage issues as the eastbound side.</p> <p>It is recommended that the catchbasins be replaced with ditch inlets that have higher visibility and more drainage capacity. A more frequent cleanout plan is recommended for future maintenance of the ditches within the study limits.</p> <p>Storm sewer CCTV and cleanout would also be recommended to ensure no sewer blockage is causing the standing water.</p>

Drainage Issue	Pictures		Observations & Recommendations
<p>C – Within cut area from mile marker 507.25 to Northumberland County Road 26, there are ineffective catchbasins due to erodible soil that covers them in significant rainfall. Alternate drainage system is required.</p>			<p>Erosion was present and covers the catch basins for both sides of the freeway. Found catch basins with metal detector. Still water was present on the eastbound side.</p> <p>It is recommended that the catchbasins be replaced with ditch inlets that have higher visibility and more drainage capacity. A more frequent cleanout plan is recommended for future maintenance of the ditches within the study limits.</p> <p>Storm sewer CCTV and cleanout would also be recommended as sediment from the scoured areas may caused sewer blockage.</p>
<p>D – Ditching between mile marker 509.5 – 511 has been challenging. Erodible soil fills ditches and causes water to flow on the shoulders.</p>			<p>Still water is present on the eastbound side.</p> <p>Erosion blankets are recommended for all cut slopes to improve slope stability and reduce erodible soil from filling the existing ditches.</p> <p>It is recommended that existing catchbasins in the ditches be replaced with ditch inlets to increase visibility for maintenance purposes and to increase capacity to take runoff when partially blocked.</p> <p>Storm sewer CCTV and cleanout is also recommended.</p>
<p>E – Drainage within County Road 30, Brighton interchange N/S-E ramp is a concern. Eroded soil regularly washes onto EB on ramp.</p>			<p>Erosion is present. Edge of shoulder is cracking and breaking.</p> <p>It is recommended that erosion blankets be implemented in the cut slopes to improve slope stability and reduce the amount of erodible soils. Special types of vegetation may also help to stabilize the slope.</p>

Drainage Issue	Pictures	Observations & Recommendations
<p>F – Drainage and saturated grade of the WB ramps for County Road 30 Brighton (mile marker 509) have been an ongoing issue creating hazardous conditions.</p>		<p>Erosion is present. Looked like there is a berm at the side near the guardrail. Pavement is cracking. It is recommended that the road shoulder be regraded to facilitate drainage away from the roadway.</p>

Drainage Issue	Pictures	Observations & Recommendations
<p>G – Ongoing washout concerns from County Road 26, easterly to the end of the fill area EB.</p>		<p>There was no ditch found due to erosion / washout. It is recommended that erosion blankets be implemented in the cut slopes to improve slope stability and reduce the presence of erodible soils. Ditching is recommended to be cleaned out and regraded.</p>
<p>H – From mile marker 515 - 520 there are significant areas with no drainage. Standing water in ditches which causes cattails and phragmites to flourish and are unmaintainable. There is no drainage from the ROW so ditch cleanout is unable to be performed.</p>		<p>Standing water is present as well as phragmites. Under proposed conditions, the ditching is recommended to be regraded to ensure adequate drainage. Slope protection is also recommended to reduce erodible soils in the ditches.</p>

Drainage Issue	Pictures	Observations & Recommendations
<p>I – Culvert at the north fence line (near GPS coordinate 44.082447 N, 77.728133 W) conveys water to the ROW ditch inlet. Culvert is buried and plugged with silt due to eroded material from the north. This cause erosion of the ROW.</p>		<p>Field staff were unable to locate the buried culvert at the GPS coordinate with the metal detector. Could not find any evidence of erosion near the indicated coordinate. The culvert is recommended to be cleaned out and it is recommended to be flagged for more frequent maintenance checks. An alternative recommendation would be to remove the culvert and replace it with a rock lined ditch to convey flows.</p>

[this page is intentionally left blank]

4 EXISTING DRAINAGE CONDITIONS

4.1 Existing Culvert Locations and Characteristics

There are 42 culverts in this study area, four of them are structural culverts. **Table 4-1** summarizes the existing structural culvert characteristics while **Table 4-2** summarizes the existing non-structural culvert characteristics.

Table 4-1: Summary of Existing Structural Culvert Characteristics

Culvert ID	Highway Lanes	Township	Station ID	Dimension (mm) and Type	Flow Direction
471	EB / WB	Cramahe	18+386	4200 x 2400 RFB	S-N
472	EB / WB	Cramahe	18+914	4200 x 2400 RFB	S-N
473	EB / WB	Cramahe	19+710	4200 x 2400 RFB	N-S
474	EB / WB	Brighton	10+215	4200 x 2400 RFB	S-N

Table 4-2: Summary of Existing Non-Structural Culvert Characteristics

Culvert ID	Highway Lanes	Station ID	Dimension (mm) and Type	Flow Direction
Cramahe Township				
0020	WB	13+057	900 CSP	N-S
0051	EB	13+060	900 CSP	N-S
0019	WB	13+277	700 CSP	N-S

4.2 Drainage Mosaics

Catchment areas were delineated for each culvert under existing conditions using contour maps covering the study area. Existing drainage mosaics, **4-1** to **4-11** are attached at the end of this report in the exhibits section. It shows the location of the existing structural and non-structural culverts and their catchment delineation.

4.3 Existing Conditions Hydrologic Modelling

Hydrologic modelling was completed for existing conditions to simulate the hydrologic responses of the drainage areas during the design storm. It calculated runoff

characteristics during different return periods for the catchment area contributing to each culvert.

Hydrologic results for drainage areas with a directly connected impervious land use greater than 20 percent, the design storms are calculated using the STANDHYD instantaneous unit hydrograph.

Hydrologic results for drainage areas with a directly connected impervious land use less than 20 percent, the design storms are calculated using the NASH instantaneous unit hydrograph (NASHYD).

4.3.1 Flow Rate Calculations Under Existing Conditions

Hydrologic parameters were estimated for each drainage area based on the Curve Number (CN), the Time to Peak (T_p), initial pervious abstraction and percentage of imperviousness. The initial pervious abstraction refers to the portion of precipitation that gets stored in the watershed and does not contribute to the runoff process. The abstraction losses include interception, infiltration to soil moisture storage and depression storage. The initial pervious abstraction values are dependant on the topography of the drainage area, soil cover and initial moisture conditions. The hydrologic parameters are summarized in **Table 4-3**.

A Visual OTTHYMO 6.2 hydrologic model was created using the above parameters. The 12-hour SCS storm distribution, catchment parameters and the future rainfall data for the projected year 2097, taken from MTO IDF Curve Lookup Tool was used to calculate the flow rates for the 2, 5, 10, 25, 50 and 100-year storm events with Climate Change consideration. The peak flows for the structural culverts are summarized in **Table 4-4** while **Table 4-5** summarizes the peak flows for the non-structural culverts.

Six culverts have contributing catchment areas that have waterbodies and/or wetlands that provide storage throughout the catchment. Based on Design Chart 1.06 in the MTO Drainage Management Manual, dated 1997, and the percentage of waterbodies and wetland in the catchment, an appropriate reduction factor was applied to the discharge flows for the design and check storm. **Table 4-6** summarizes the design and check flows with the reduction factor applied.

Table 4-6: Peak Discharge Flow Reduction to Allow for Storage Under Existing Conditions

Culvert ID	AW/A %	Type of Curve	KS	Peak Flow Rates (m ³ /s)

0010	2.95	C	0.690	2.041	2.377

4.4 Existing Conditions Hydraulic Assessment

The design standards for the hydraulic assessment of culverts are based on the MTO HDDS (2008), discussed in **Section 2.1**. To estimate the headwater depth and assess the hydraulic capacity of existing culverts within the study area, a CulvertMaster and HEC-RAS hydraulic modelling tool was used.

A HEC-RAS model was used to analyze the structural culverts while a CulvertMaster model was used for the non-structural culverts.

4.4.1 Hydraulic Results Under Existing Conditions

The 50-year storm was used as the design storm and the 100-year storm was used as the check storm for all culverts with a span less than 6 m. The hydraulic analysis involved the comparison of the headwater elevation and the elevation at which water would spill onto the highway. This comparison will determine if the existing culvert meets the freeboard and flood depth design criteria.

There is a total of five existing non-structural culverts that do not meet the design criteria.

Hydraulic analysis for each of the four existing structural culverts are summarized in **Table 4-7, Table 4-8, Table 4-9 and Table 4-10**.

4-11 summarizes the hydraulic analysis of the existing non-structural culverts.

Highlighted cells include numbers that are relevant to the design criteria as follows:

- The desired freeboard criteria is such that the design storm energy grade line elevation is > 1.0 m for culverts that cross under roadways.
- The minimum freeboard criteria is such that the design storm water surface elevation is > 1.0 m for culverts that cross under roadways.
- The required HW/D for culverts with diameter or rise > 4.5 m under the design storm is < 1.0 m

The HEC-RAS results are included in **Appendix D-1** and the CulvertMaster output files are included in **Appendix D-2**.

Table 4-7: Existing Hydraulic Performance Summary for Culvert 471

Description	2-year	5-year	10-year	25-year	50-year	100-year
Water Surface Elevation	171.54	171.74	171.88	172.05	172.18	172.30
Energy Grade line Elevation	171.54	171.75	171.88	172.05	172.18	172.30
Top of Road (low Point)	174.54	174.54	174.54	174.54	174.54	174.54
(2+4) Top of Road Freeboard (min.)	3.00	2.80	2.66	2.49	2.36	2.24
(3) Top of Road Freeboard (desired)	3.00	2.79	2.66	2.49	2.36	2.24
Soffit Elevation (upstream)	173.09	173.09	173.09	173.09	173.09	173.09
(6) Soffit Clearance	1.55	1.35	1.21	1.04	0.91	0.79
(7) HW/D	0.35	0.44	0.49	0.57	0.62	0.67

Under existing conditions, culvert 471 meets all relevant design criteria including:

- HW/D Ratio < 1.0 m for culverts with spans > 4.5 m for a design storm of 50-years
- Freeboard > 1.0 m for culverts that cross under roadways for the design storm of 50-years

The culvert is propositioned to be replaced under proposed conditions as a result of the highway widening. The structural culvert is also reaching the end of it's designed life span.

Table 4-8: Existing Hydraulic Performance Summary for Culvert 472

Description	2-year	5-year	10-year	25-year	50-year	100-year
Water Surface Elevation	170.88	171.16	171.35	171.59	171.77	171.99

(3) Top of Road Freeboard (desired)	7.57	7.28	7.10	6.86	6.68	6.52

Description	2-year	5-year	10-year	25-year	50-year	100-year
Soffit Elevation (upstream)	172.30	172.30	172.30	172.30	172.30	172.30
(6) Soffit Clearance	1.42	1.14	0.95	0.71	0.53	0.31
(7) HW/D	0.41	0.52	0.60	0.70	0.78	0.87

Under existing conditions, culvert 472 meets all relevant design criteria including:

- HW/D Ratio < 1.0 m for culverts with spans > 4.5 m for a design storm of 50-years
- Freeboard > 1.0 m for culverts that cross under roadways for the design storm of 50-years

The culvert is propositioned to be replaced under proposed conditions as a result of the highway widening.

Table 4-9: Existing Hydraulic Performance Summary for Culvert 473

Description	2-year	5-year	10-year	25-year	50-year	100-year
Water Surface Elevation	180.17	180.47	180.67	180.91	181.10	181.26

Top of Road (low Point)	186.90	186.90	186.90	186.90	186.90	186.90
(2+4) Top of Road Freeboard (min.)	2.04	1.94	1.87	1.77	1.68	1.59
(3) Top of Road Freeboard (desired)	1.99	1.85	1.75	1.63	1.52	1.43
Soffit Elevation (upstream)	186.02	186.02	186.02	186.02	186.02	186.02
(6) Soffit Clearance	1.16	1.06	0.99	0.89	0.80	0.71
(7) HW/D	0.52	0.56	0.59	0.63	0.67	0.71

Under existing conditions, culvert 474 meets all relevant design criteria including:

- HW/D Ratio < 1.0 m for culverts with spans > 4.5 m for a design storm of 50-years
- Freeboard > 1.0 m for culverts that cross under roadways for the design storm of 50-years

The culvert is propositioned to be replaced under proposed conditions as a result of the highway widening. The structural culvert is also reaching the end of it's designed life span.

Table 4-11: Summary of Existing Hydraulic Analysis for Non-Structural Culverts

0004	20+600	900	182.20	180.69	1.51	180.75	1.45	0.71

Culverts 0019, 0015, 0056, 0014 and 0057 in Cramahe Township do not meet design criteria under existing conditions.

4.5 Existing Storm Sewer Assessment

Existing runoff from Highway 401 within the study area flows towards the grassed median and side ditches. When a concrete median is present instead of a grassed median, runoff flowing towards the median will be collected through existing catch basins and conveyed to an outlet through existing storm sewers. The outlets discharge to the outer ditches of the highway.

4.5.1 Rainfall

As previously stated, the MTO Lookup tool was used to find the 2097 rainfall climate projection for this study area. The general equation that fits to an IDF Curve for a specific location and return period is provided below:

$$I = AT_c^B$$

Where,

I = rainfall intensity (mm/hr)

T_c = Time of concentration (min)

A and B = coefficients (differs per design storm and dependent on geographic location)

By graphing the rainfall intensity values from the MTO IDF Lookup tool and finding the trend line equations, the A and B values were found for all storm events. **Table 4-12** summarizes the calculated coefficients for all storm events.

Table 4-12: 2097 A & B Coefficients for the 2-year to 100-year Based on MTO Lookup Tool

Coefficients	2-year	5-year	10-year	25-year	50-year	100-year
A	24.048	30.986	35.591	41.362	45.628	49.849
B	-0.678	-0.681	-0.683	-0.686	-0.686	-0.689

4.5.2 Analysis

An existing storm sewer assessment was completed using rainfall intensities for the 10-year design storm and the catchment areas of each catch basin. **Table 4-13** summarizes the existing storm sewer characteristics such as spacing (distance between one catch basin to the next), pipe size and slope.

Exhibits 4-12 to 4-27 show the existing storm sewer catchment areas. Each drainage area includes the eastbound and westbound lane contribution to the catch basins. Catchments 530, 535 and 540 drains towards an outlet that is outside the project limits.

The analysis for the existing storm sewers concluded that all existing pipes have at least the minimum velocity of 0.5 m/s. The detailed analysis is located in **Appendix E**.

5 PROPOSED DRAINAGE CONDITIONS

This section discusses the drainage requirements to accommodate the proposed Highway 401 widening.

5.1 Proposed Conditions Crossing Culverts

For the preliminary design, headwalls are proposed for 26 culvert ends that are located within the proposed grass median. Further ditching and median design and analysis will be carried out in the detail design phase, which includes the possibility of wingwalls being required for the culvert ends located in the side ditching.

5.1.1 Flow Rate Calculations Under Proposed Conditions

As in **Section 4.3.1** hydrologic parameters were estimated for each catchment under proposed conditions. These parameters are summarized in **Table 5-1**. The proposed peak flow values for the structural and non-structural culverts are summarized in **Table 5-2** and **Table 5-3**. The catchments under proposed conditions are shown in **Exhibits 5-1 to 5-11**.

As stated in **Section 4.3.1**, six culverts have contributing catchment areas that have waterbodies and or wetlands that provide storage throughout the catchment. **Table 5-4** summarizes the peak flows with the applied reduction factor from Design Chart 1.06 in the MTO Drainage Management Manual.

5.2 Proposed Conditions Hydraulic Assessment

The hydraulic assessment under proposed conditions was completed in the same way as the existing conditions by using CulverMaster and HEC-RAS modelling tools with the MTO HDDS design standards. The culvert lengths were lengthened to accommodate the road widening and the invert elevations were updated to match the new proposed lengths. Scour review is recommended to be completed during the detailed design.

5.2.1 Hydraulic Results Under Proposed Conditions

Hydraulic analysis for each structural culverts under proposed conditions are summarized in **Table 5-5**, **Table 5-6**, **Table 5-7** and **Table 5-8**.

Table 5-9 summarizes the hydraulic analysis for the non-structural culverts under proposed conditions.

The HEC-RAS results are included in **Appendix D-1** and the CulvertMaster output files are included in **Appendix D-2**.

From the results above 11 non-structural culverts are proposed for replacement. Two were recommended to be replaced from the Ainley Group Final Culvert Condition Reports (2015). Five are being replaced due to not meeting the design criteria under existing conditions and the last four are getting replaced because the existing size does not meet the design criteria under proposed conditions.

All proposed structural culverts meet relevant design criteria and have a lower observed water level compared to existing conditions due to the flattening of the proposed culvert to better follow the watercourse slope and increased width of culvert.

Under the detailed design phase, detailed area survey should be obtained to refine the watercourse tie-in design as the surveyed cross-sections during the preliminary design was intended for use in the HEC-RAS modelling and elevations outside of the surveyed cross-sections are estimated.

Table 5-10 summarizes all the culvert recommendations for the structural and non-structural culverts.

Table 5-10: Culvert Recommendations

Culvert ID	Township	Station	Proposed Recommendations
Structural			
471	Cramahe	18+386	Replace with 4800 x 2400 mm box culvert embedded 300 mm
472	Cramahe	18+914	Replace with 4800 x 2400 mm box culvert embedded 300 mm
473	Cramahe	19+710	Replace with 4800 x 2400 mm box culvert embedded 300 mm
474	Brighton	10+215	Replace with 4800 x 2400 mm box culvert embedded 300 mm
Non- Structural			
0020	Cramahe	13+057	Extend culvert with a 900 mm pipe (like for like), a catch basin may be required in the median
0051	Cramahe	13+060	Extend culvert with a 900 mm pipe (like for like), a catch basin may be required in the median
0019	Cramahe	13+277	Replace with a 1000 mm CSP, headwall proposed in the median
0052	Cramahe	13+277	Replace with a 1000 mm CSP, headwall proposed in the median
0018	Cramahe	13+520	Extend culvert with a 900 mm pipe (like for like), headwall proposed in median
0053	Cramahe	13+527	Replace with a 1000 mm CSP, headwall proposed in the median
0017	Cramahe	14+112	Extend culvert with a 700 mm pipe (like for like), headwall proposed in median
0054	Cramahe	14+112	Extend culvert with a 900 mm pipe (like for like), headwall proposed in median
0016	Cramahe	14+328	Extend culvert with a 900 mm pipe (like for like), headwall proposed in median
0055	Cramahe	14+328	Extend culvert with a 900 mm pipe (like for like), headwall proposed in median
0015	Cramahe	14+542	Replace with a 1200 mm CSP, headwall proposed in the median
0056	Cramahe	14+548	Replace with a 1200 mm CSP, headwall proposed in the median
0014	Cramahe	14+959	Replace with a 2400 x 1500 mm NRFB, headwall proposed in the median
0057	Cramahe	14+968	Replace with a 2400 x 1500 mm NRFB, headwall proposed in the median

0001	Brighton	20+600	Extend culvert with 900 mm CSP (like for like) on the ditch side, storm sewer system will connect 0001 and 0004 in the proposed concrete median
0004	Brighton	20+600	Extend culvert with 900 mm CSP (like for like) on the ditch side, storm sewer system will connect 004 and 0001 in the proposed concrete median

5.3 Proposed Drainage Patterns

Under proposed drainage conditions, two additional lanes will be constructed either within the outer grassed ditch or one lane will be added on the inside shoulder while the other will be added on the outside shoulder. The proposed cross-section of the highway will include four lanes and shoulders on each of the eastbound and westbound lanes.

In most areas of the proposed design, runoff from the two inner lanes and median shoulders will be captured by catch basins. In some other areas of the proposed design, runoff from all four lanes and median shoulders or just the median shoulders will be collected by catch basins. Runoff that is not being captured by the catch basins will sheet flow to the highway outer ditches and ultimately flow to either municipal drains or a watercourse.

Proposed storm sewer networks will be discharging to the highway outer ditches through storm sewer outlets. The existing drainage pattern will be maintained and the existing storm sewer outlets will be utilized whenever possible in the areas of the study limits that are not being realigned. In the one small section that is proposed to be realigned, a new storm sewer network will need to be installed. Another small section will also need to add a new storm sewer network, as the grassed median is being proposed to change into a concrete median.

5.4 Proposed Storm Sewer Design

This section documents the hydraulic assessment of the existing storm sewers under proposed conditions and the proposed storm sewers in the section of road that has a new alignment or for the small section that is proposed to be changed from a grassed median to a concrete median. The catchment drainage areas are illustrated in **Exhibits 5-12 to 5-30**.

As previously stated, existing storm sewers and outlets are utilized where applicable. In some sections, the existing storm sewer size will need to be increased due to the increase in catchment size. The slope and spacing are proposed to stay the same as the existing. The storm sewer sections that will be needed to be upgraded are summarized in **Table 5-11**

In the areas where Highway 401 is proposed to be realigned and the small section that is proposed to change from grassed median to concrete median, the storm sewer slope was selected to match the highway grade and will follow the design standards summarized in **Table 2-1**. Where cover is deficient, pipe insulation will be proposed. **Table 5-12** summarizes the new storm sewer characteristics for the new storm sewer segments.

A flow spread calculation was completed under proposed conditions. For preliminary design, it analyzed three locations that are designed to capture the most runoff, has the furthest spacing and with the lowest slope to confirm that travel lanes would stay free of flooding and that flow spread will be limited to the shoulder width under heavy storm events. The three locations have a proposed shoulder width of 6 m, 4 m and 5.3 m. The spread calculated for the three locations will stay within the proposed shoulder width for both the minor and major storm. Since the analysis met the flow spread design requirements the other locations that have greater slope, smaller catchments and smaller spacing, should also meet the design criteria. The calculated spread analysis is included in **Appendix E**. A more detailed analysis will be completed for the detailed design.

Due to the realignment, two outlets will need to be abandoned, while the others can remain in their existing locations. Whether the outlets can be plugged and abandoned or will need to be removed shall be determined during the detailed design stage.

For the section that is being changed from grassed median to concrete median, three outlets are needed but the outlets are going to be connected to two existing culverts and a ditch outlet. Table 5-13 summarizes the outlets to be abandoned or kept and the newly proposed outlets are presented in **Table 5-14**. The detailed analysis is located in **Appendix E**.

There is an increase in impervious area, because of the increase in the highway pavement footprint and the proposed widening. Due to the new alignment with the storm sewers spaced 150 m apart there is less catchment areas in that section of road than there was under existing conditions. Additional storm sewer catchments were added (615 to 635) to design the storm sewer sizes for the section of road that is proposed to change from a grassed median to a concrete median. **Table 5-15** summarizes the proposed drainage area for the catchments under proposed conditions.

6 STORMWATER MANAGEMENT PLAN PERFORMANCE

6.1 Stormwater Management Criteria

Stormwater management criteria, based on the Ministry of the Environment, Conservation and Parks (MECP) and MTO standards, are summarized as follows:

- Minimize increases in flows up to the 100-year storm
- Maintain or enhance the quality of runoff discharge from the highway right of way (ROW)

The MCEP Stormwater Management Planning and Design Manual (2003), the MTO Drainage Management Manual (1997) and MTO HDDS (2008) provided policies and guidelines for the selection and design of the stormwater management measures required to enhance the quality of runoff and provide water quantity control. The following guidelines from the MTO HDDS were used in the assessment:

SW-1: Stormwater Management – Level of Control: This standard conforms to the provincial approach of water quality as outlined in the MECP SWM Manual (2003) and is based upon the level of removal of suspended solids for water quality control, directed to fisheries protection.

Enhanced protection or greater shall be used when sensitive aquatic habitat will be impacted by discharge from the highway drainage system. As such 80% TSS removal is recommended for this site.

SW-3: Roadside Ditches for Water Quality: This standard includes the following:

- Removal efficiency will conform to the quality control criteria specified in SW-1.
- Highway embankments shall be a minimum of 3 m in length measured transversely from the outside of the shoulder to the invert of the roadside ditch. Dense vegetation cover shall be used to improve water quality and prevent erosion of the embankment.
- Minimum ditch base width shall be 1.0 m. To improve water quality the roadside ditch shall be planted with dense vegetation cover.
- Minimum ditch length shall be 40 m measured from the furthest downstream storm sewer outfall to the receiving watercourse.

Table 6-1 presents a list of SWM features along with the design criteria associated to their design. These are typical SWM features used in MTO ROW.

Table 6-1: Summary of Possible SWM Features

SWM Feature	Criteria
Traditional SWM Pond	Provide an enhanced (Level 1) level of protection (80% long term suspended solids removal) per MECP requirements
	Provide extended detention of the 25 mm rainfall events for erosion control plus 40 m ³ /ha for water quality enhancement
	Include a sediment forebay for settling suspended solids
	Include a 3.0 m deep permanent pool with bottom draw outlet
	Include consideration for re-aeration downstream of the ponds
	Include an access road to facilitate maintenance of the forebay
Linear Wet Ponds	Provide an enhanced (Level 1) level of protection (80% long term suspended solids removal) per MECP requirements
	Provide extended detention of the 25 mm rainfall events for erosion control plus 40 m ³ /ha for water quality enhancement
	Include a 3.0 m deep permanent pool with bottom draw outlet
	Include 4:1 side slopes against the highway and 3:1 side slopes outside
	Include consideration for re-aeration downstream of the linear ponds
Linear Dry Ponds	Provide extended detention of the 25 mm rainfall events for erosion control plus 40 m ³ /ha for water quality enhancement
Enhanced Grassed Swales	Bottom width shall be a minimum of 1.0 m
	Minimum longitudinal slope of 0.5% up to a maximum of 4%
Oil / Grit Separators	Provide at least 80% TSS removal

6.2 Discussion of SWM Alternatives

Under existing conditions, drainage is provided by storm sewers, roadside ditching and municipal drains. Open ditches are recognized as water quality control measures that provide sediment filtration.

Under proposed conditions, most existing storm sewers are being proposed to remain in a similar location, while some other sections are newly proposed or being moved due to the new alignment in a section.

Downstream control points were created to compare pre- to post-development flows within the right of way (ROW). The catchments were created from highpoint to highpoint

along the road profile. There is very little difference of the road profile between existing conditions and proposed conditions, therefore the same catchments are used for pre-development and post-development flow analysis. **Table 6-2** compares existing and proposed flow rates for the created catchments.

Table 6-2: Pre to Post-Development Conditions Comparison

Catchment ID	Chainage		Existing 100-year Flow (L/s)	Proposed 100-year Flow (L/s)	Difference (L/s)	Difference (%)
	From	To				
Cramahe Township						
1	12+500	13+500	2772	3382	610	22
2	13+500	16+580	8522	11713	3191	37
3	16+580	17+720	3746	4523	777	21
4	17+720	19+400	4730	5196	466	10

10	15+815	17+870	5633	7133	1500	27
11	17+870	19+662	4623	6494	1871	40
12	19+662	20+720	2672	3615	942	35
13	20+720	20+971	564	724	160	28

6.3 Preliminary Stormwater Management Strategy

6.3.1 Quantity Control

MTO is committed to minimizing increases in stormwater peak flows up to the pre-development 100-year storm at all outlets from the MTO ROW to minimize the risk to downstream riparian landowners due to the added impervious land use from the proposed highway widening.

Based on the pre-post comparison from **Table 6-2** there is a total increased flow of 25% due to an increase in impervious area of 62% of 32 ha from existing conditions across the full study limit. This is based on the ultimate conditions of full highway twinning within the study limits.

The 13 outlet control points within the study limits have been assessed on their required storage based on the pre- to post- flow comparison for the 100-year storm as presented in **Table 6-3**.

Table 6-3: Storage Required at Outlet Control Points

Catchment ID	Chainage		Existing 100-year Flow (m ³ /s)	Area (ha)	Runoff Coefficient (C)	Required Storage (m ³)
	From	To				
Cramahe Township						
1	12+500	13+500	2.77	10.09	0.56	379
2	13+500	16+580	8.52	35.93	0.55	1941
3	16+580	17+720	3.75	14.50	0.52	482
4	17+720	19+400	4.73	15.88	0.55	382
5	19+400	20+200	2.42	8.58	0.52	188
Brighton Township						
6	20+200	10+930	2.48	9.40	0.58	457
7	10+930	11+770	2.14	8.63	0.59	526
8	11+770	12+600	2.06	8.16	0.60	519
9	15+200	15+815	1.87	6.28	0.54	142
10	15+815	17+870	5.63	21.38	0.56	914
11	17+870	19+662	4.62	18.71	0.58	1121
12	19+662	20+720	2.67	10.67	0.57	565
13	20+720	20+971	0.56	2.04	0.60	98

Storage will be provided in the roadside ditches in the form of grassed swales with rock check dams depending on the available space and previously identified drainage issues. Grassed swales with a bottom width of 1 m, a 6:1 foreslope, and a 3:1 backslope was assessed and the required ditch length to provide adequate quantity control throughout the project area is 8816 m, split between the 13 outlet control points. The full storage and ditch calculations can be found in **Appendix F**.

6.3.2 Water Balance and Quality Control

For water balance, the first 5 mm of stormwater runoff volume shall be retained on site and managed by ways of infiltration, evapotranspiration, or re-use. For this project, the method of water balance will be infiltration.

The site is recommended to provide enhanced level protection of 80% TSS removal. Grassed swales should be sized to convey the peak flows from a 4-hour 25 mm Chicago storm with a velocity of 0.5 m/s.

Based on the imperviousness, Table 3.2 of the MOECC (now MECP) Stormwater Management Planning and Design Manual details the storage volume required for different stormwater management plans such as infiltration, wetlands, hybrid wet pond / wetland, and wet ponds.

For this project, quality control will be provided in the form of enhanced grassed swales with rock check dams. A summary of the required treatment volume and required total swale volume can be found in **Table 6-4**. This table also shows that the required treatment volume for each catchment is less than the 5 mm runoff volume, which meets the quality control requirements.

Table 6-4: Quality Control - Water Quality Storage Sizing

7 EROSION AND SEDIMENT CONTROL MEASURES

Erosion and sediment control measures will be implemented during all phases of construction, clean-up and restoration to prevent sediment-laden runoff from entering any of the watercourses directly from the construction zone. The measures will include management of any residual flow or the potential for flow in the watercourses where fish habitat was confirmed.

During construction, uncontrolled sedimentation and erosion can result in a disruption of nearby watercourses, a degradation of downstream water quality and a loss of topsoil. Erosion and sedimentation control measures should be implemented during construction to prevent the migration of soils from the site. The recommended erosion and sedimentation control measures that should be considered are the following:

Vegetative:

- 1 All areas not subject to active construction 30 days after area grading should be top soiled and seeded immediately after completion of such grading.
- 2 Immediately following seed application, a straw erosion blanket should be installed on any exposed slopes adjacent to sensitive features.

Structural:

- 1 As construction proceeds, diversion swales should be graded where needed along the ROW boundaries to intercept drainage from external areas and direct it away from exposed surfaces.
- 2 Temporary sedimentation traps and silt fencing should be placed around outlets and inlets from existing culverts in the drainage system.
- 3 All culvert work should be conducted “in the dry”.
- 4 Temporary silt fencing should be installed around sensitive vegetative features.
- 5 Flow checks should be provided in roadside ditches.
- 6 Additional erosion control works may be required during the course of construction. These may consist of swales, silt fences, and/or diversion berms. The location and need for these works will be established in the field.

The integration of these measures will minimize the impacts of erosion and sedimentation during construction.

8 CONCLUSIONS

MTO retained WSP to prepare a Preliminary Design and EA for replacement or rehabilitation of structures and a Preliminary Design for the future widening of Highway 401.

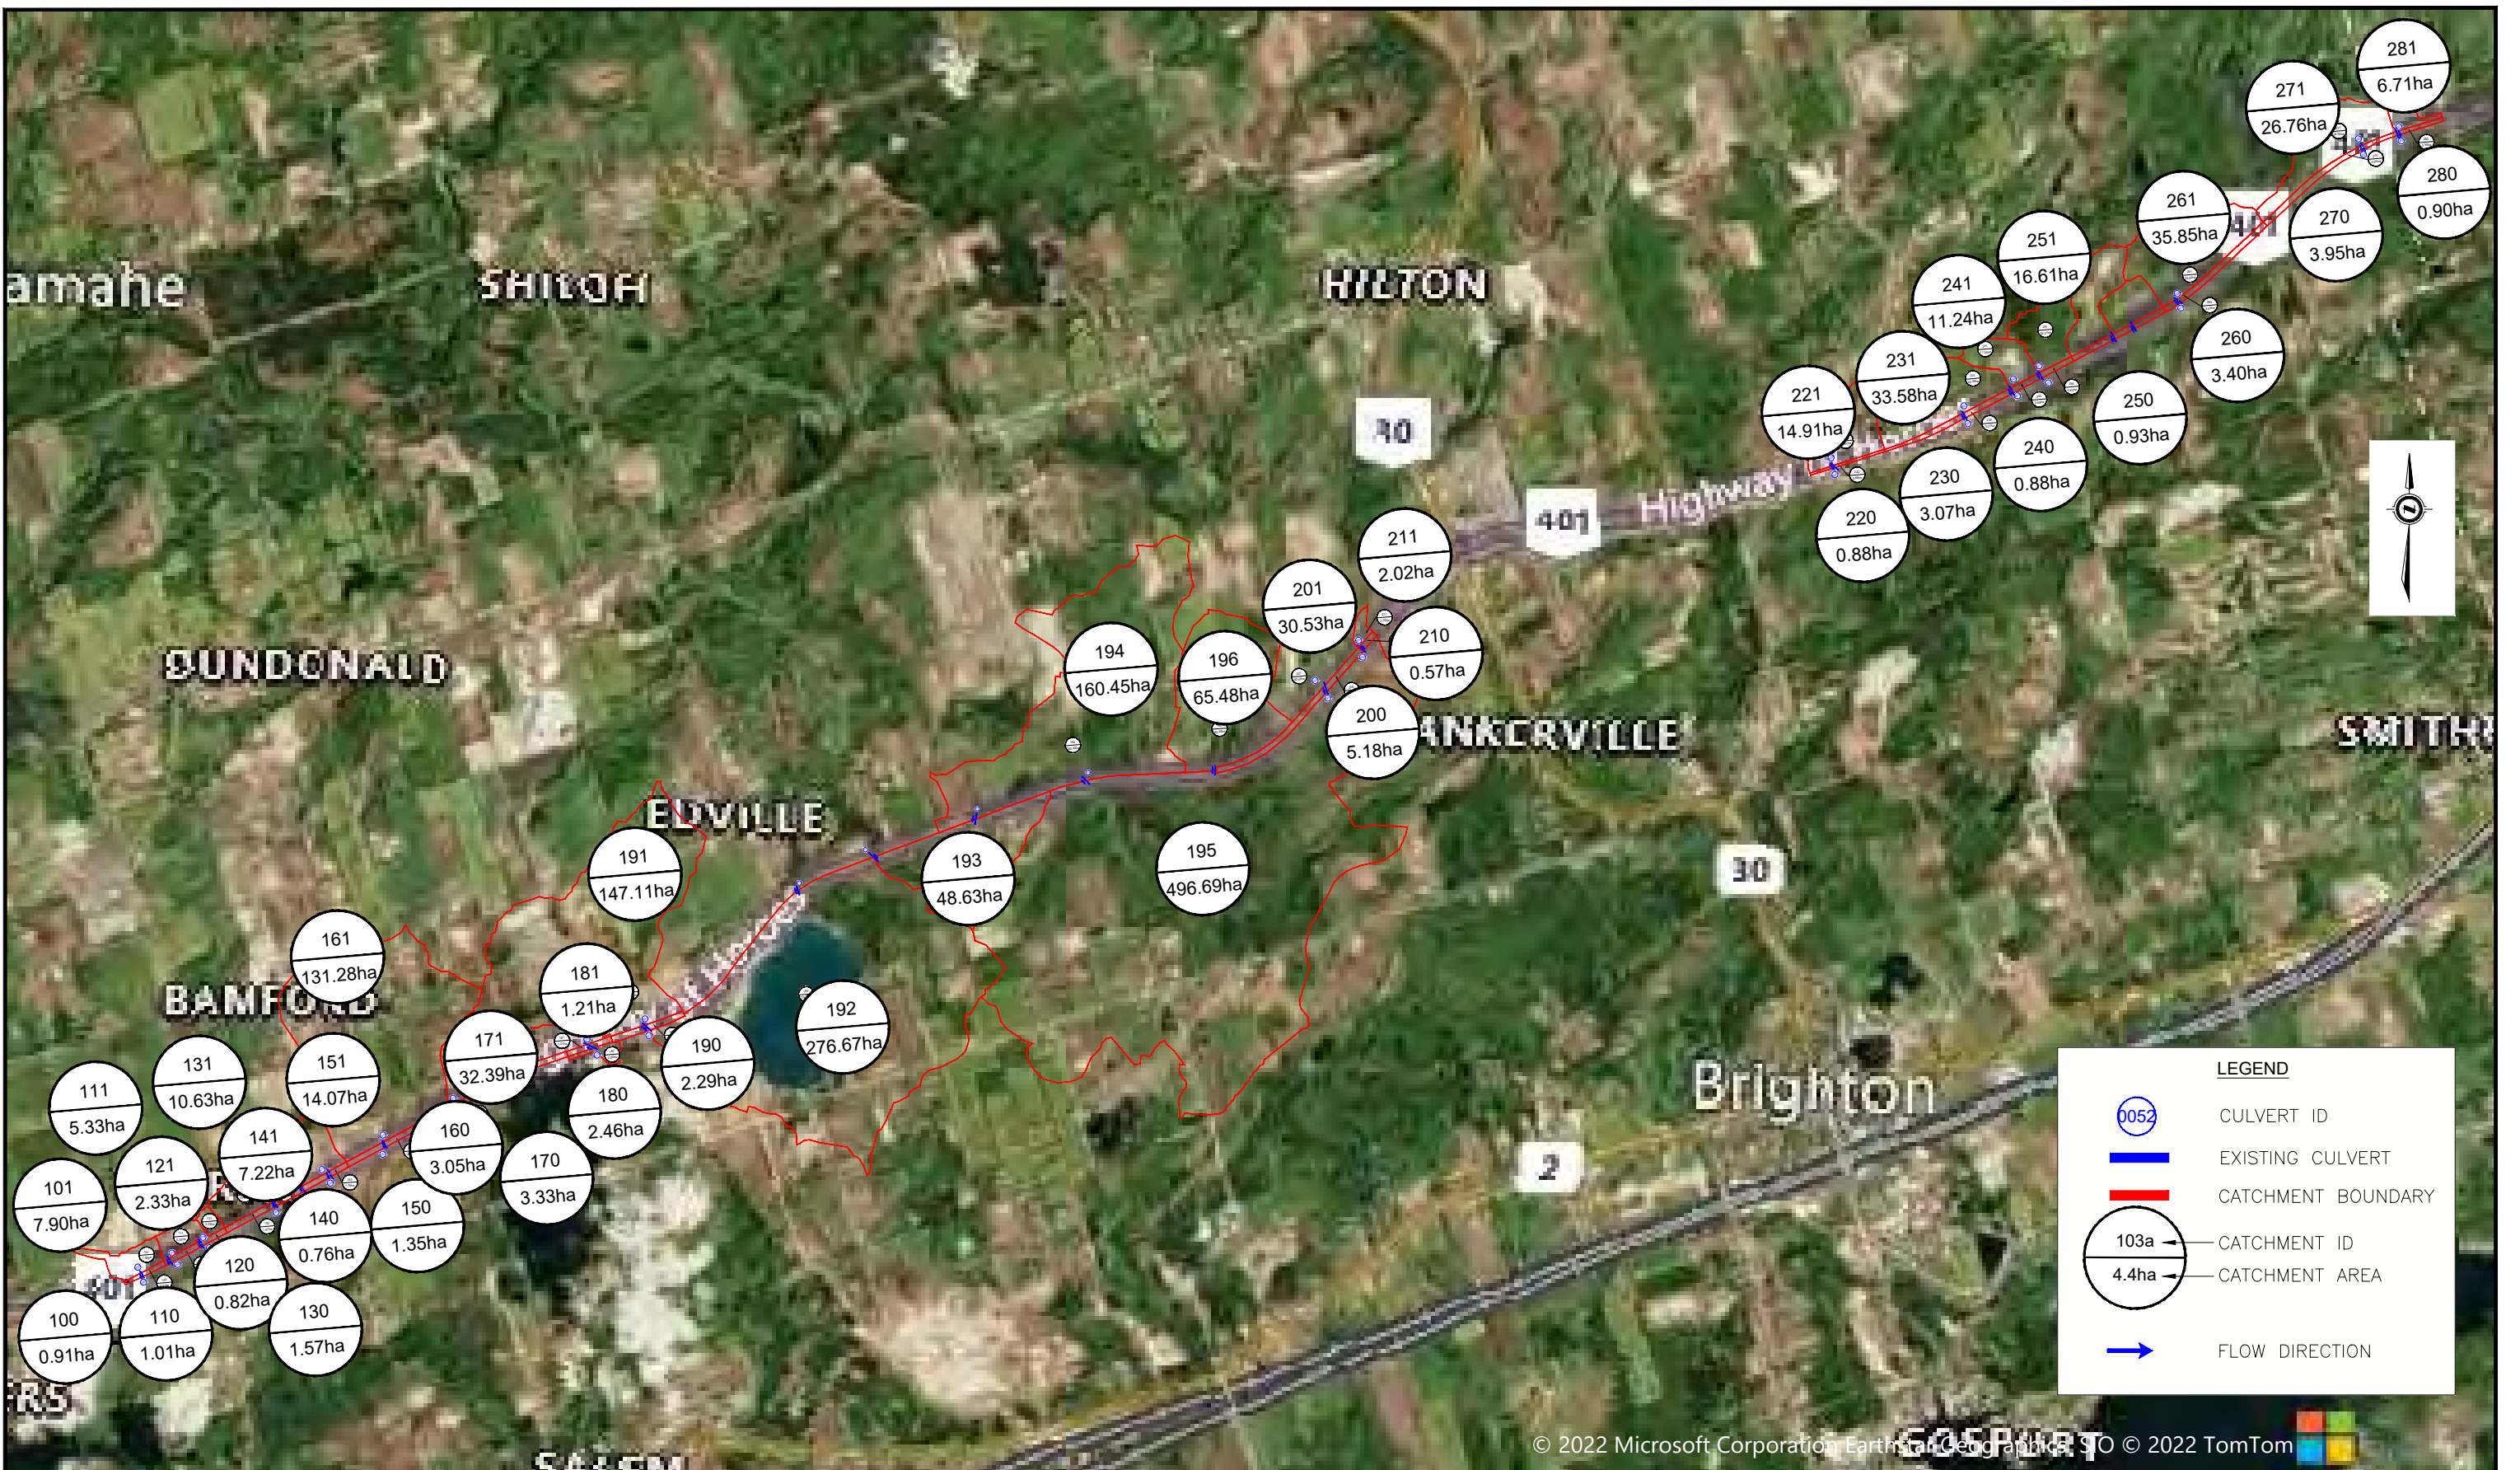

This report contains existing hydrologic and hydraulic assessments of the structural and non-structural culverts as well as analysis of the existing storm sewer network.

Assessments of all culverts and storm sewer networks under proposed conditions were completed. A preliminary stormwater management plan is also included. The following conclusions can be made from the assessments:

- 1 The existing drainage systems consist of open ditches, swales, ditch inlets, outlets, culverts and storm sewers.
- 2 Under existing conditions:
 - a Runoff from highway lanes is discharged either to the median ditch or the side ditches. The median ditch sections discharge through culverts to the outer ditches.
 - b In sections where median ditches are not present, runoff is conveyed towards the concrete median is captured by catch basins and conveyed through storm sewers and outlets to the outer ditches.
 - c All culverts except five non-structural culverts meet all relevant design criteria.
- 3 Under proposed conditions:
 - a For the sections with the new alignment and where it is proposed to change from a grassed median to a concrete median, new storm sewer segments are proposed.
 - b Six sewer pipe sections need to be upgraded to a larger sized pipe.
 - c Under proposed conditions, five culverts were recommended to be increased in size to meet design criteria.
 - d The four structural culverts are recommended to be replaced with 4800 x 2400 mm concrete box culverts.
 - e Stormwater management will be provided in the form of enhanced grassed swales with check dams with potential of linear dry ponds.
 - f Existing drainage patterns will be maintained where feasible.
- 4 Sediment and erosion control measures will be implemented during all phases of construction, clean-up and restoration to prevent sediment-laden runoff from entering any of the watercourses directly from the construction zone.

Culvert Inspection Sheets

Culvert Inspection Form

Location Information	Rough Sketch
----------------------	--------------

Culvert ID:	C471	WP/GWP:	4054-17-00
Highway	401		
Location			
Chainage:	18+386		
TOWNSHIP	Cramahe		
Pipe Skew	30 degrees		

Physical Characteristics			
Material Type:	Concrete box		
Material Thickness	290	(mm)	
(H) Depth of Cover:	1 m		
Diameter (or size):	4300x2100 (mm)		
Water Course:	Stream <input checked="" type="checkbox"/> Ditch <input type="checkbox"/> Standing <input type="checkbox"/> Undefined <input type="checkbox"/>		
Water Depth (mm):	230	Upstream	
	240	Downstream	

Roadway Observations

Road Surface Condition: (sags, pavement cracking, clearance)

Observations:

South(u/s) -Small crack on shoulder

North (d/s)-Cracks from median shoulder to about edge of driving lane

Embankment Conditions: (slope failures, water damage)

Observations:

South(u/s)-good condition

North(d/s)-bankment erosion

Fill Type: Earth Fill Rock Fill

Culvert Observations

Condition Culvert Overall: (Joint defects, Seam defects, plate buckling, lateral shifting missing bolts, corrosion, excessive abrasion) Good Fair Poor

Comments:

South(u/s)-good condition

north (d/s)-erosion at the end of culvert, good condition. Highway water level mark is about 10 cm above the water level.

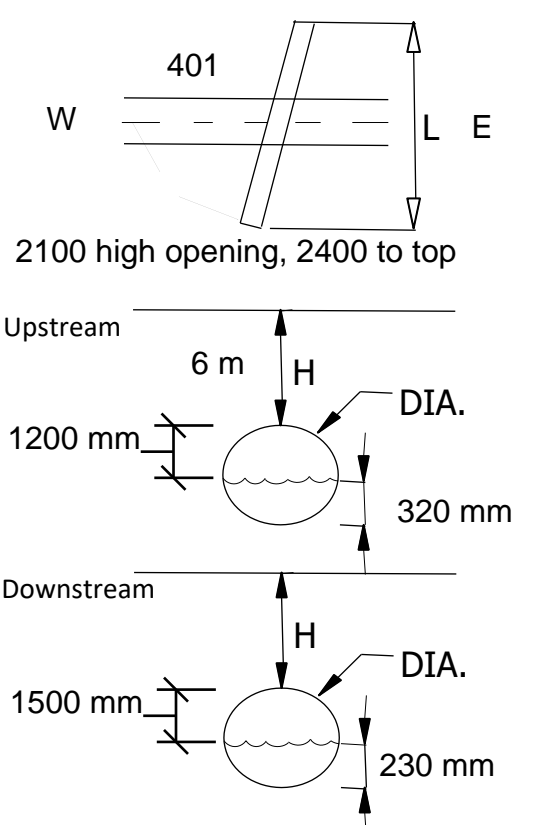

Beaver Dam drainage issue (A):unstable marshy ground unable to access and couldn't pass wildlife fence

Prepared by: BT & EH

Date: May 3, 2022

Culvert Inspection Form

Location Information		Rough Sketch	
Culvert ID: C473	WP/GWP: 4054-17-00		
Highway	401		
Location			
Chainage:	19+710		
TOWNSHIP	Cramahe		
Pipe Skew	~62 degrees		
Physical Characteristics			
Material Type:	Concrete box		
Material Thickness	320 mm (mm)		
(H) Depth of Cover:	~6 m		
Diameter (or size):	4300x 2400 (mm)		
Water Course:	Stream <input checked="" type="checkbox"/> Ditch <input type="checkbox"/> Standing <input type="checkbox"/> Undefined <input type="checkbox"/>		
Water Depth (mm):	320 Upstream		
	230 Downstream		
Roadway Observations			
Road Surface Condition: (sags, pavement cracking, clearance)			
Observations:			
South (d/s)- no visible cracks			
North(u/s) - no visible cracks			
Embankment Conditions: (slope failures, water damage)			
Observations:			
South(d/s)- good embankment			
North(u/s)- some erosion			
Fill Type: Earth Fill <input checked="" type="checkbox"/> Rock Fill <input type="checkbox"/>			

Culvert Observations

Condition Culvert Overall: (Joint defects, Seam defects, plate buckling, lateral shifting missing bolts, corrosion, excessive abrasion) Good Fair Poor

Comments:

South(d/s)- exposed rebar on end, as well as some cracking at the ends

North(u/s) - good conditions, minor watercourse bank erosion, fallen tree in stream

Prepared by: BT & EH Date: May 3, 2022

APPENDIX

A-3 Drainage Issues Field Notes

terrafix®

Project No: _____ Project Title: 401 Colborne to Brighton

Description: _____ Date: May 3, 2022

East bound → drainage issue B = standing water within ROW
west of ~~an~~ 473 to east 474

- some standing water → ditch drainage poor
- 1036 pic → erosion and standing water
- 1037 pic → silt fence down
- 1038 pic → ditch inlet or catch basin ✓
- some areas are marshy
- about 90% of ditch is standing water

terrafix®

Project No: 441 Project Title: 401 Colborne to Brighton

Description: _____ Date: May 4, 2022

westbound
Buried culvert near GPS coords 44.082491 N 77.728133 W
Topic 3406, 3405, 3404 → checked for missing/buried
culvert @ GPS coordinates, could not find any erosion
or ^{buried} culvert, used metal detector

Catch Basin Issues (C) → erosion covers them → & (D)

- photos 3407 - 3415 → catch basin (C) → some fer (D)
- photos 3416 - 3420 → catch basin (C)
- photos 3421 - 3423 → erodible soil (D)

Drainage issue (F)

- photo 3424 → 3426 road grading → some erosion on side
- photos 3430 → 3437 ramp, shows some erosion
- kind of bolls like there is a berm @ side near guard rail
- photos 3438 → 3441 → ditch @ MM 509.0

B - N side → westbound

- photos → 3442 → 3446 → doesn't look & like there is too much drainage issues some ponding near fence line.

Eastbound on next
page →

Project No: _____ Project Title: 401 Colborne to Brighton

Description: _____ Date: May 4, 2022

Eastbound

Eastbound ramp (E)

- photos → 3447 → 3450 → erosion

Eastbound CB (C) & (D)

- photos → 3452 → 3459 → found with metal detector
→ couldn't clear out
→ still water

Issue (G)

→ Washout concerns is warranted

→ photos 3460 - 3464

→ there was an existing ditch but now there isn't

(H) Issue

- MM 515.5 → photos phragmites → standing water
→ photos 3465 → 3470

- MM 517.5 → phragmites → standing water
→ photos → 3471 - 3478
